

Information on DNA tests

Two types of DNA testing are available:

1/ BREED TESTING: so you can find out exactly what breeds are in your dog . The test identifies the breeds of their parents and grandparents. This service is not available for cats.

The Aim of the DNA test is to:

- Discover your dog's genetic make-up.
- Predict your dog's target genetic adult weight range
- Determine your dog's recommended nutritional program, and create an effective care and wellness program in conjunction with your veterinarian
- Obtain a better understanding of your dog's breed-related behavioural characteristics

2/ HEALTH TESTING: identify specific genetic health problems that your dog or cat may be carrying.

Dogs are screened for 35 different genetic diseases

Cats are screened for 5

What is involved:

A small blood sample is taken and this is sent to the U.S.A for analysis against a data base of over a million dogs

The results are emailed direct to you after 3-4 weeks .
